TITLE OF THE INVENTION

Conductive Fluoro-Resin Compositions

5

BACKGROUND OF THE INVENTION

Field of the Invention

This invention relates to conductive polyether based  
10 fluoro-resin compositions which cure into parts having high  
conductivity, improved heat resistance, weather resistance  
and solvent resistance and optionally forming firm bonds to  
various substrates. The compositions are effective in die  
bonding of semiconductor devices and mounting of quartz  
15 crystal oscillators.

Prior Art

Conductive compositions loaded with silver particles  
find major applications in die bonding of semiconductor  
20 devices and mounting of quartz crystal oscillators. The  
prior art conductive compositions used in this field are  
epoxy resin compositions loaded with silver particles.

With the recent advance in precision of devices and  
parts, however, conductive epoxy resin-based compositions  
25 tend to impose substantial stresses to parts and devices on  
account of the rigidity of the epoxy resins and thus have a  
considerable influence on the assembly properties. Softer  
rubbery conductive materials are thus desirable. Conductive  
adhesives of the silicone class are proposed, for example,  
30 in JP-A 133432/1995 corresponding to EP 653,463.

The conductive siloxane composition of this patent  
experiences a substantial change of conductivity by heat  
shocks. The influence of low molecular weight compounds on  
the surrounding electric parts becomes concern, which is  
35 another drawback of the siloxane composition. There is a  
desire to have conductive materials of higher quality.

SUMMARY OF THE INVENTION

We have found that when a fluorinated polyether composition of the type curing through hydrosilylation reaction comprising (A) a reactive fluorinated polyether compound comprising fluorinated polyether units and having at least two aliphatic unsaturated hydrocarbon radicals in a molecule, (B) a compound having at least two hydrogen atoms each directly attached to a silicon atom, and (C) a platinum group metal catalyst is further blended with (D) silver particles, there is obtained a conductive fluoro-resin composition which cures into parts having improved conductivity, heat resistance, weather resistance and solvent resistance and optionally forming firm bonds to various substrates, which satisfies the requirements for the advanced precision parts, and which is effective in die bonding of semiconductor devices and mounting of quartz crystal oscillators.

Component (D) used is preferably silver particles containing at least 10% by weight of dendrite (treelike) or flake shaped silver particles based on the loading of the silver particles. More preferred are silver particles, especially flake shaped silver particles, which have been surface treated with an organopolysiloxane or fluorinated polyether compound. By blending specific silver particles, the conductive fluoro-resin composition is further improved in that the risk of undercure is eliminated and the separation with time of silver particles is prohibited.

The invention provides a conductive fluoro-resin composition comprising

(A) 100 parts by weight of a reactive fluorinated polyether compound comprising fluorinated polyether units and having at least two aliphatic unsaturated hydrocarbon radicals in a molecule,

(B) a compound having at least two hydrogen atoms each directly attached to a silicon atom in a sufficient amount to give 0.4 to 10 equivalents of the silicon atom-attached hydrogen atoms relative to the aliphatic unsaturated hydrocarbon radicals in component (A),

(C) a sufficient amount of a platinum group metal catalyst to promote reaction between components (A) and (B), and

(D) 50 to 2,000 parts by weight of silver particles.

5

DETAILED DESCRIPTION OF THE INVENTION

Component (A) of the conductive fluoro-resin composition according to the invention is a reactive fluorinated polyether compound comprising fluorinated 10 polyether units and having at least two aliphatic unsaturated hydrocarbon radicals in a molecule. It is a base polymer of the composition of the invention.

In the reactive fluorinated polyether compound (A), the fluorinated polyether units are preferably of the following 15 structural formula (1):

wherein Rf is a straight or branched chain perfluoroalkylene 20 radical having 1 to 6 carbon atoms, and q is an integer of 1 to 500.

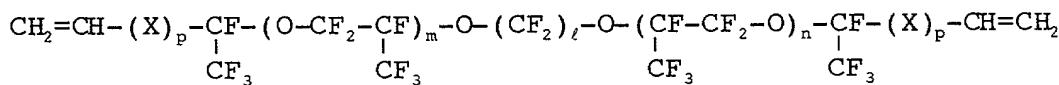

In formula (1), Rf is a straight or branched chain perfluoroalkylene radical having 1 to 6 carbon atoms, preferably 1 to 3 carbon atoms. Illustrative examples of the 25  $-Rf-O-$  radical include  $-CF_2O-$ ,  $-CF_2-CF_2-O-$ ,  $-CF_2-CF_2-CF_2-O-$ ,  $-CF_2-CF_2-CF_2-CF_2-O-$ ,  $-CF(CF_3)-CF_2-O-$ , and  $-CF(CF_3)_2-O-$ . There may be included such recurring units of one or more than one type. Letter q is an integer of 1 to 500, preferably 2 to 400, more preferably 10 to 200.

30 The aliphatic unsaturated hydrocarbon radicals are preferably alkenyl radicals having 2 to 8 carbon atoms, for example, vinyl, allyl, propenyl, isopropenyl, butenyl, hexenyl, and cyclohexenyl, preferably those radicals terminated with a  $CH_2=CH-$  structure, with the vinyl and allyl 35 being most preferred.

While the reactive fluorinated polyether compound should have at least two aliphatic unsaturated hydrocarbon radicals in a molecule, the aliphatic unsaturated

hydrocarbon radicals may be attached to both ends of the backbone of a linear fluoropolyether compound directly or via other atoms or groups or to an intermediate of the molecule. It is preferred in view of curability and cured properties that the aliphatic unsaturated hydrocarbon radicals be directly or indirectly attached to both ends of the backbone of a linear or branched fluoropolyether compound.

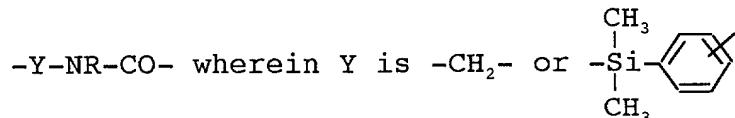

Typical examples of the reactive fluorinated polyether compound are compounds of the following general formula (2).

Formula (2)

15

In formula (2), X is independently  $-\text{CH}_2-$ ,  $-\text{CH}_2\text{O}-$  or

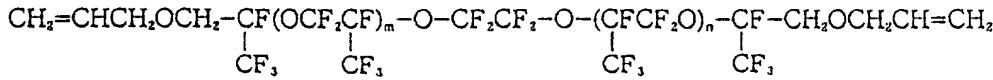

20 (inclusive of o, m and p-positions), R is hydrogen, methyl, phenyl or allyl, letter p is independently equal to 0 or 1, l is an integer of 2 to 6, m and n are independently integers of 0 to 200, preferably 5 to 100.

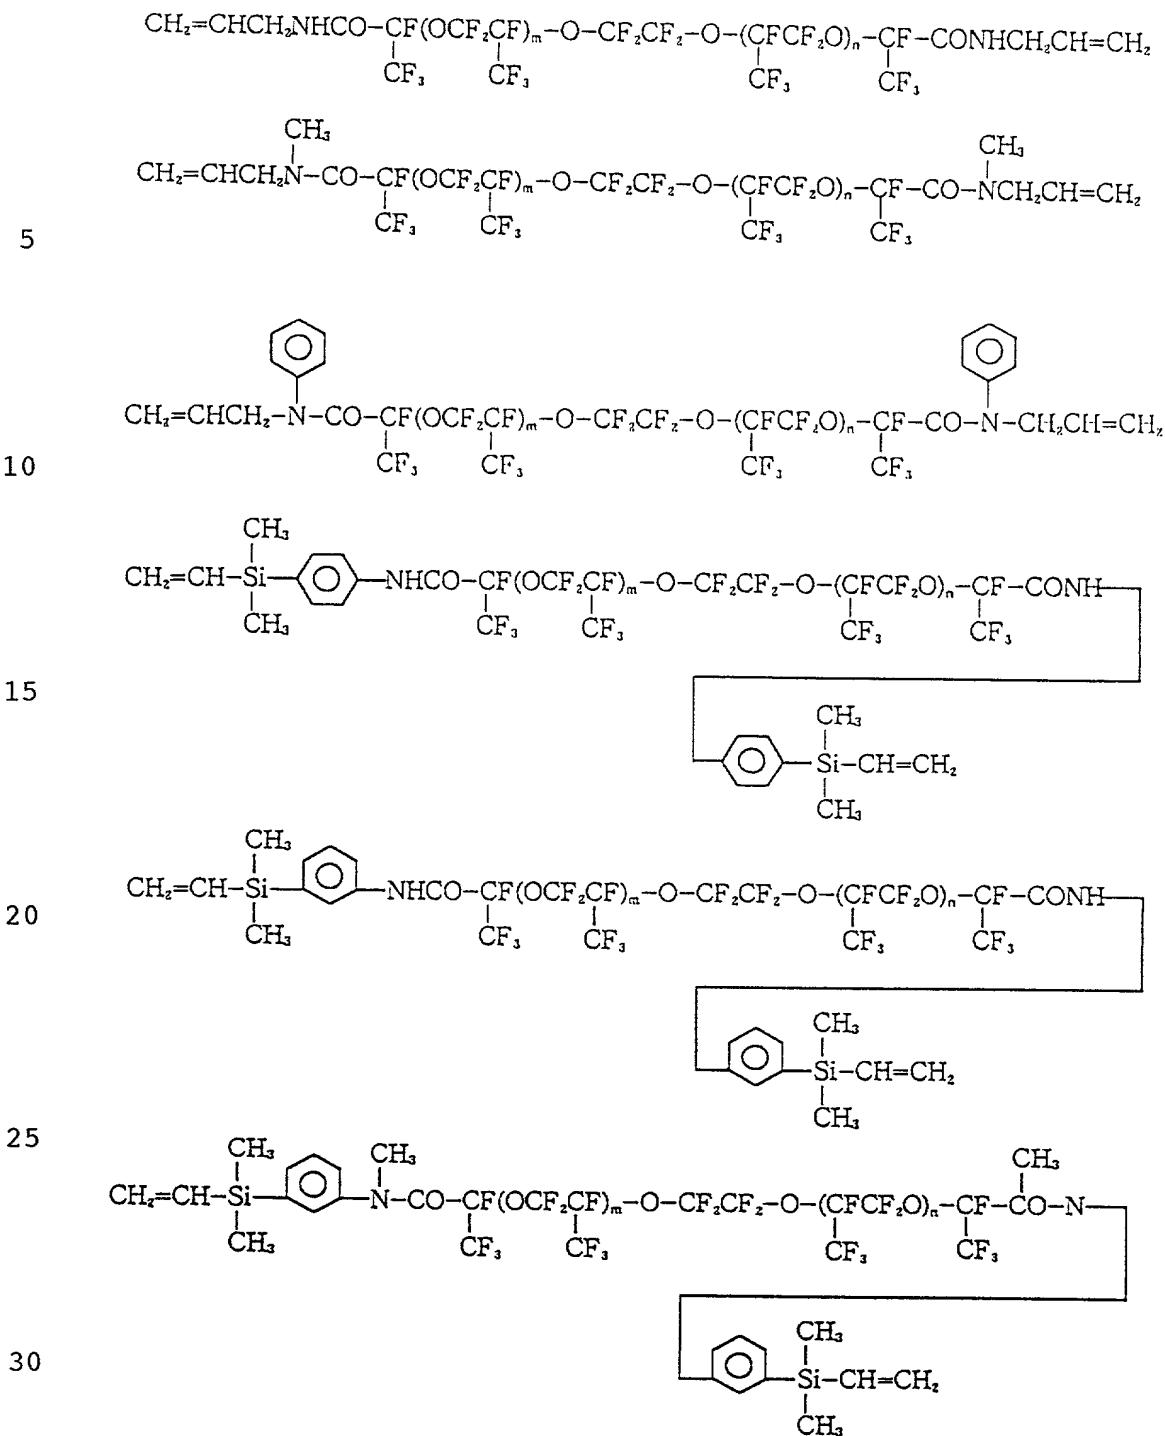

Desirably, the reactive fluorinated polyether compounds of formula (2) have a number average molecular weight of about 400 to about 100,000, especially about 1,000 to about 50,000. Although the compounds of formula (2) are linear polymers, the recurring units  $-\text{Rf}-\text{O}-$  may be either straight or branched, and branched compounds are acceptable as component (A).

Illustrative examples of the reactive fluorinated polyether compound of formula (2) are given below.

35

In the formulas,  $m$  and  $n$  are independently integers of 0 to 250, preferably 10 to 200.

35 The linear fluoropolyether compound may be adjusted to a desired molecular weight for a particular purpose. For example, addition reaction by hydrosilylation is effected between a linear fluorinated polyether compound having

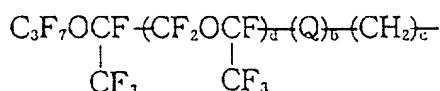

alkenyl radicals only at both ends of its molecular chain and an organic silicon compound such as an organopolysiloxane having two SiH radicals within its molecule (typically at both ends of its molecular chain). The 5 resulting chain-extended product (such as a fluorinated polyether-siloxane block copolymer having fluorinated polyether moieties at both ends) may be used as component (A).

Component (B) is a compound having at least two 10 hydrogen atoms each directly attached to a silicon atom, that is, at least two SiH radicals, preferably at least three SiH radicals. Since component (B) serves as a crosslinking agent, it may be any of compounds having SiH radicals capable of hydrosilylation reaction with aliphatic 15 unsaturated hydrocarbon radicals in component (A) in the presence of the platinum group metal catalyst (C), for example, organohydrogenpolysiloxanes having unsubstituted or fluorine-substituted monovalent hydrocarbon radicals or perfluoropolyether-containing hydrocarbon radicals as 20 monovalent substituents (organo radicals) on silicon atoms, hydrosilyl radical-containing perfluoro hydrocarbon compounds, and hydrosilyl radical-containing perfluoropolyether compounds. Most often, organohydrogenpolysiloxanes which are commonly employed in reaction of 25 organopolysiloxanes are conveniently used. For the compatibility with component (A), low molecular weight organohydrogenpolysiloxanes and cyclic organohydrogenpolycyclosiloxanes having about 2 to about 10 silicon atoms, especially about 3 to about 5 silicon atoms are preferable 30 where the monovalent substituent (or organo radical) attached to a silicon atom is an unsubstituted monovalent hydrocarbon radical free of a fluorine-substituted hydrocarbon radical.

The unsubstituted monovalent hydrocarbon radicals may 35 be those having 1 to about 12 carbon atoms, preferably those having 1 to about 8 carbon atoms and free of an aliphatic unsaturated bond, for example, alkyl radicals such as methyl, ethyl, propyl, isopropyl, butyl, isobutyl, tert-

butyl, hexyl, cyclohexyl, and octyl, alkenyl radicals such as vinyl, allyl, propenyl, and butenyl, aryl radicals such as phenyl, tolyl, xylol, and naphthyl, and aralkyl radicals such as phenylethyl and phenylpropyl. The fluorine-5 substituted monovalent hydrocarbon radicals or perfluoro-polyether-containing hydrocarbon radicals include perfluoroalkyl radicals having 1 to 12 carbon atoms as well as monovalent radicals of the following formulas.

$$10 \quad \text{CF}_3\text{---}(\text{CF}_2)_n\text{---}(\text{Q})_p\text{---}(\text{CH}_2)_c\text{---}$$

15 a: an integer of 0 to 9

b: 0 or 1

c: 2 or 3

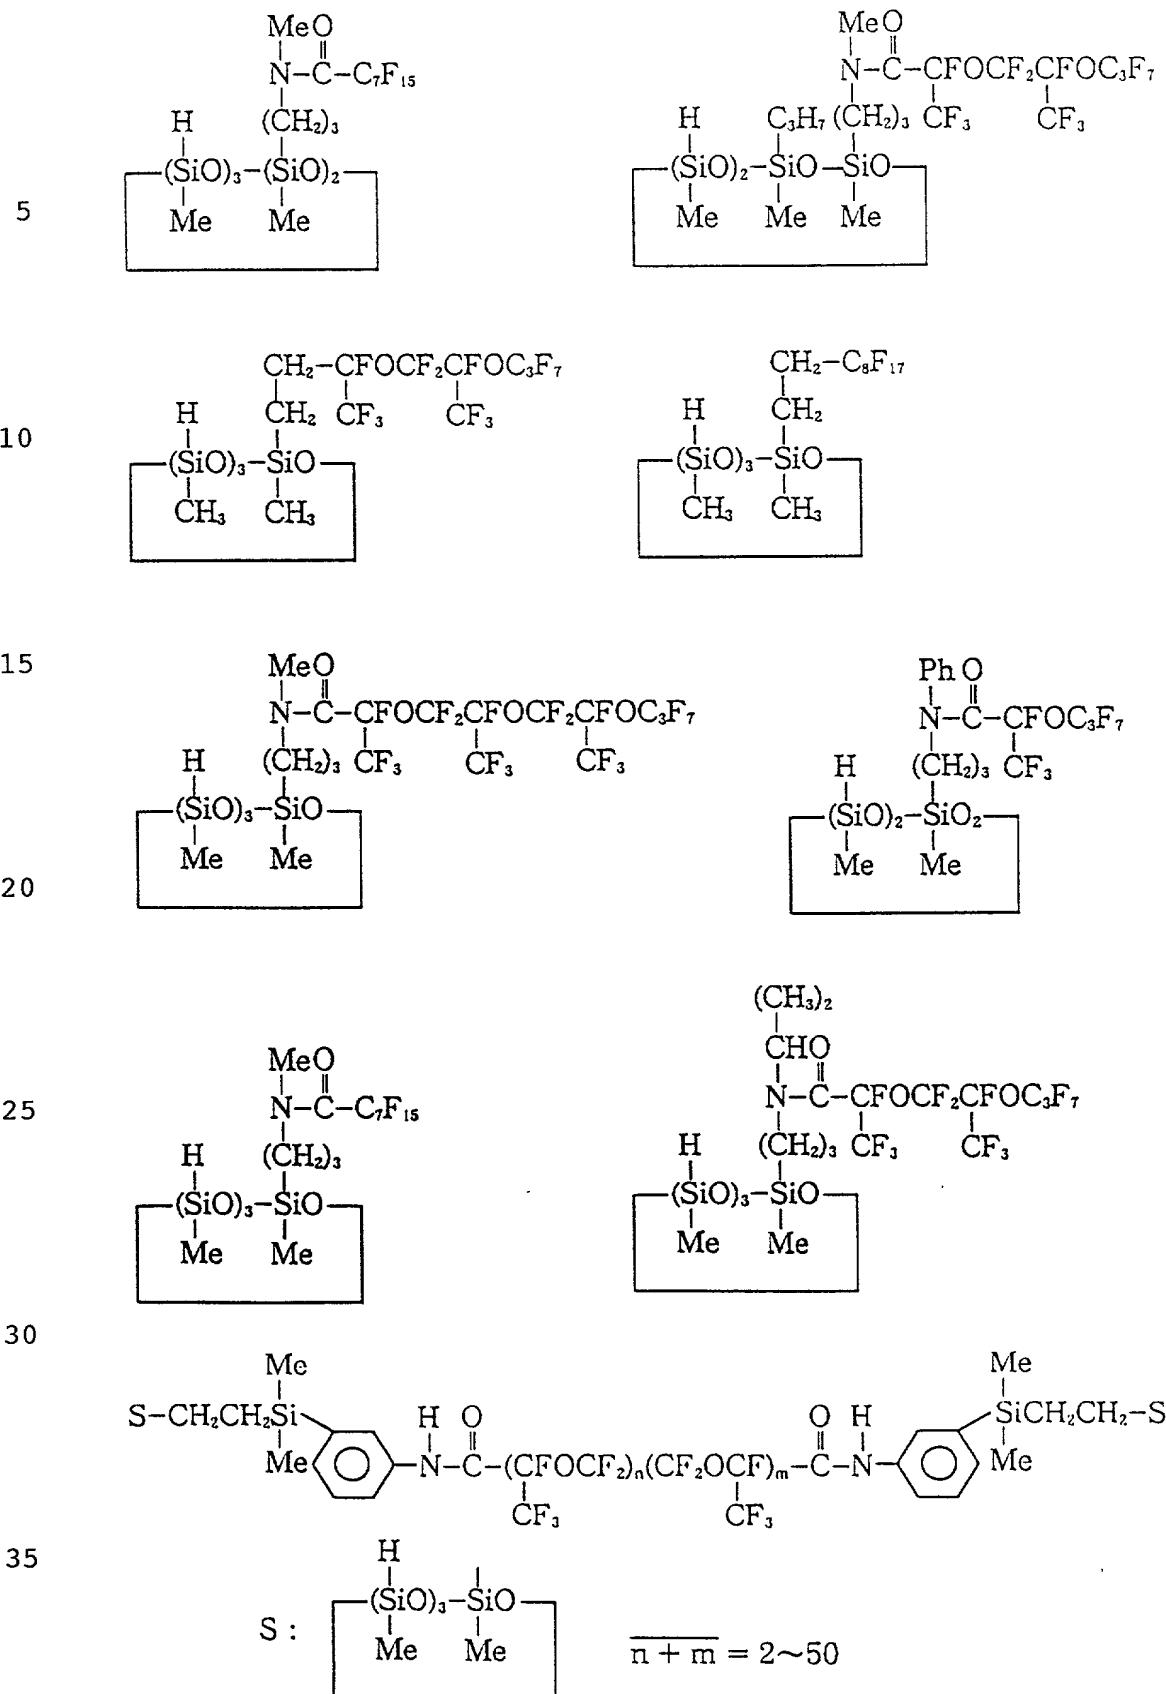

d: an integer of 0 to 5

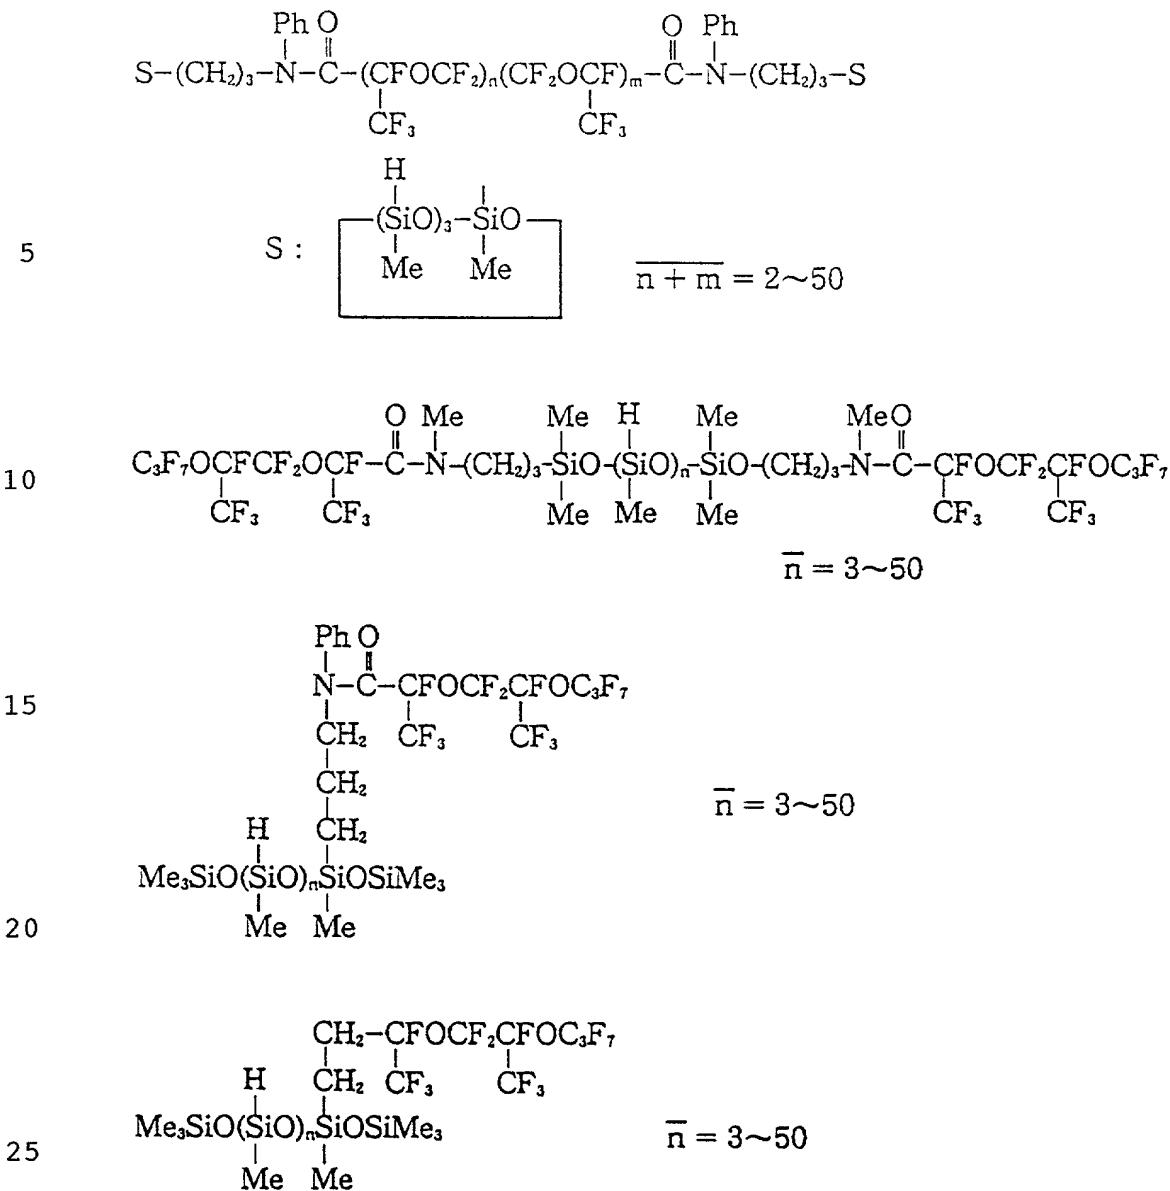

20 Q:  $-\overset{\underset{\text{CH}_3}{\text{N}}}{\underset{\text{||}}{\text{C}}}-$  ,  $-\overset{\underset{\text{C}_3\text{H}_7}{\text{N}}}{\underset{\text{||}}{\text{C}}}-$  ,  $-\overset{\underset{\text{C}_6\text{H}_5}{\text{N}}}{\underset{\text{||}}{\text{C}}}-$  or  $-\overset{\underset{\text{H}}{\text{N}}}{\underset{\text{||}}{\text{C}}}-$

When high molecular weight siloxanes are used, they are preferably modified with fluorine compounds for improving the compatibility with component (A). Other preferred SiH sources are perfluoropolyether and perfluoropolyalkylene compounds having SiH radicals at ends of their backbone.

Illustrative examples of the compound (B) are given below. Note that Me is methyl and Ph is phenyl.

$  \begin{array}{c}  \text{H} \quad \text{O} \\  \parallel \\  \text{N}-\text{C}-\text{CFOCF}_2\text{FOC}_3\text{F}_7 \\    \quad \quad   \\  (\text{CH}_2)_3 \quad \text{CF}_3 \quad \quad \text{CF}_3 \\    \\  (\text{SiO})_3-\text{SiO} \\    \quad \quad   \\  \text{Me} \quad \text{Me}  \end{array}  $	30	$  \begin{array}{c}  \text{Ph} \quad \text{O} \\  \parallel \\  \text{N}-\text{C}-\text{CFOC}_3\text{F}_7 \\    \quad \quad   \\  (\text{CH}_2)_3 \quad \text{CF}_3 \\    \\  (\text{SiO})_3-\text{SiO} \\    \quad \quad   \\  \text{Me} \quad \text{Me}  \end{array}  $
	35	

The amount of component (B) blended is to give 0.4 to 10 equivalents (mol/mol) of the silicon atom-attached hydrogen atoms (that is, SiH radicals) relative to the aliphatic unsaturated hydrocarbon radicals in component (A), preferably 0.8 to 5 equivalents (mol/mol) of the SiH radicals.

Component (C) is a platinum group metal catalyst which may be selected from platinum group transition metals and compounds thereof which are conventionally employed in hydrosilylation reaction. Exemplary platinum group transition metals are platinum group metals such as Pt, Rh, and Pd. Exemplary platinum group metal compounds include

chloroplatinic acid, modified complexes of chloroplatinic acid with olefins, modified complexes of chloroplatinic acid with alcohols, modified complexes of chloroplatinic acid with vinylsiloxanes,  $\text{RhCl}_3$ ,  $\text{Rh}(\text{CH}_3\text{COCHCOCH}_3)_3$ ,  $\text{Rh}(\text{PPh}_3)_3\text{Cl}$ ,  
5  $\text{Rh}(\text{PPh}_3)_3\text{Br}$ ,  $\text{Rh}_2(\text{AcO})_4$  wherein Ac is acetyl,  $\text{Rh}(\text{PPh}_3)_2(\text{CO})\text{Cl}$ ,  
 $\text{Rh}(\eta^4\text{-C}_7\text{H}_8)\text{Cl}$ ,  $\text{Rh}(\text{CH}_3\text{COCHCOCH}_3)(\text{CO})_2$ ,  $\text{Rh}_4(\text{CO})_{12}$ ,  $\text{Rh}(\text{CO})_{16}$ ,  
 $\text{Rh}(\text{PPh}_3)_3(\text{CO})\text{H}$ ,  $(\text{NH}_4)_2\text{PdCl}_6$ ,  $(\text{NH}_4)_2\text{PdCl}_4$ ,  $\text{Pd}(\text{CH}_3\text{COCHCOCH}_3)_2$ ,  
 $\text{Pd}(\text{PhCN})_2\text{Cl}_2$ ,  $\text{Pd}(\text{PPh}_3)_2\text{Cl}_2$ , and  $\text{Pd}(\text{PPh}_3)_4$ .

Also useful as component (C) are platinum group metal  
10 compounds enclosed or microcapsulated in silicone resins  
having a melting or softening point of 40 to 150°C (which  
are organopolysiloxane resins of three-dimensional network  
structure containing trifunctional siloxane units and/or  $\text{SiO}_2$   
units), thermoplastic resins, and organic compounds having  
15 unsaturated bonds.

The amount of the platinum group metal catalyst (C)  
added is a catalytic amount sufficient to promote addition  
reaction or hydrosilylation between components (A) and (B),  
thereby causing the composition to cure. Usually, the  
20 platinum group metal catalyst (C) is used in an amount to  
give about 1 to about 2,000 parts, especially about 5 to  
about 200 parts by weight of platinum group metal per  
million parts by weight of the composition (that is,  
components (A), (B), and (D) combined).

25 Component (D) is silver particles for imparting  
electric conductivity to the composition of the invention.  
Although the type of silver particles is not critical,  
reduced silver particles, electrolytic silver particles, and  
atomized silver particles are preferred.

30 The reduced silver particles are prepared by adding a  
reducing agent such as hydrazine, formaldehyde or ascorbic  
acid to an aqueous solution of silver nitrate for reducing  
the silver salt, obtaining particulate silver. Especially  
preferred are reduced silver particles having a  $\text{NH}_4^+$  content  
35 of no more than about 10 ppm and a  $\text{SO}_4^{2-}$  content of no more  
than about 5 ppm.

2025 2020 1990 1980 1970 1960 1950 1940 1930 1920 1910 1900 1890 1880 1870 1860 1850 1840 1830 1820 1810 1800 1790 1780 1770 1760 1750 1740 1730 1720 1710 1700 1690 1680 1670 1660 1650 1640 1630 1620 1610 1600 1590 1580 1570 1560 1550 1540 1530 1520 1510 1500 1490 1480 1470 1460 1450 1440 1430 1420 1410 1400 1390 1380 1370 1360 1350 1340 1330 1320 1310 1300 1290 1280 1270 1260 1250 1240 1230 1220 1210 1200 1190 1180 1170 1160 1150 1140 1130 1120 1110 1100 1090 1080 1070 1060 1050 1040 1030 1020 1010 1000 990 980 970 960 950 940 930 920 910 900 890 880 870 860 850 840 830 820 810 800 790 780 770 760 750 740 730 720 710 700 690 680 670 660 650 640 630 620 610 600 590 580 570 560 550 540 530 520 510 500 490 480 470 460 450 440 430 420 410 400 390 380 370 360 350 340 330 320 310 300 290 280 270 260 250 240 230 220 210 200 190 180 170 160 150 140 130 120 110 100 90 80 70 60 50 40 30 20 10 0

The electrolytic silver particles are prepared by effecting electrolysis in an aqueous solution of silver nitrate, whereby dendrite silver precipitates on the cathode. The purity and other attributes of silver particles can be adjusted by selecting electrolytic conditions. Especially preferred are electrolytic silver particles having a  $\text{NH}_4^+$  content of no more than about 10 ppm and a  $\text{SO}_4^{2-}$  content of no more than about 5 ppm.

The atomized silver particles are prepared by heating silver at or above 1,000°C and atomizing the silver melt into water or inert gas. Silver is obtained in particle or irregular shape.

No particular limit is imposed on the size of silver particles although a mean particle size of 0.1 to 10  $\mu\text{m}$ , especially 0.5 to 8  $\mu\text{m}$  is preferred. The mean particle size is, for example, a weight average value (or median diameter) as determined by a particle size distribution meter using laser beam diffraction.

No particular limit is imposed on the shape of silver particles. Any one of granular, spherical, dendrite (or treelike), flake and irregular shapes or a mixture thereof is acceptable. Where the conductive composition of the invention is used in the absence of solvents, silver particles containing at least 10% by weight, especially 20 to 100% by weight of dendrite or flake shaped silver particles, especially flake shaped silver particles, based on the weight of the silver particles are preferably used in order that the composition exhibit high conductivity. If the proportion of dendrite or flake shaped silver particles is less than 10% by weight of the entire silver particles, the composition would become insufficiently conductive and unstable.

One preferred embodiment of the invention uses silver particles, especially flake shaped silver particles, which have been surface treated with an organopolysiloxane or fluorinated polyether compound. It is noted that the flake shaped silver particles are usually prepared by milling and rolling silver particles along with a surface treating agent

(or wetter) and an optional organic solvent in a well-known milling means such as a stamp mill, ball mill, vibrating mill, hammer mill, roller mill or mortar.

In the preferred embodiment of the invention, 5 organopolysiloxanes or fluorinated polyether compounds are used as the surface treating agent for the silver particles. Blending of such surface treated silver particles in the fluorinated polyether composition of the addition reaction curing type is effective for eliminating the risk of 10 undercure and preventing the silver particles from separating out with the lapse of time.

In the prior art, flake silver particles are treated with suitable agents, generally known as wetters. Examples of such surface treating agents include saturated or 15 unsaturated higher fatty acids such as lauric acid, myristic acid, palmitic acid, stearic acid, oleic acid, arachidic acid and behenic acid, metal soaps such as aluminum laurate, aluminum stearate, zinc laurate, and zinc stearate, higher aliphatic alcohols such as stearyl alcohol, esters of higher 20 aliphatic alcohols, higher aliphatic amines such as stearyl amine, higher aliphatic amides, and polyethylene wax, alone or mixtures of two or more. We found that when silver particles are treated with the above-mentioned surface 25 treating agent, about 0.1 to 3% by weight of the agent is left even after washing with a solvent. When silver particles with some surface treating agent left are blended in a fluorinated polyether composition of the addition reaction curing type, there can arise the problems of undercure and segregation with time of silver particles. 30 The present invention overcome these problems by using an organopolysiloxane or fluorinated polyether compound as the surface treating agent for flake silver particles and thus offers a conductive fluoro-resin composition of higher quality.

35 Examples of the organopolysiloxane compounds which can be used as the surface treating agent include low viscosity (liquid) to gum-like diorganopoly-siloxanes such as

PCT/JP2019/030960

both end trimethylsiloxy-blocked dimethylpolysiloxane,  
both end trimethylsiloxy-blocked dimethylsiloxane-  
methylvinylsiloxane copolymers,

15 siloxane copolymers,  
both end silanol-blocked dimethylsiloxane-diphenylsiloxane  
copolymers,  
both end silanol-blocked methylhydrogenpolysiloxane,  
both end silanol-blocked dimethylsiloxane-methylhydrogen-  
20 siloxane copolymers,  
both end dimethylvinylsiloxane-blocked dimethylpolysiloxane,  
both end dimethylvinylsiloxane-blocked dimethylsiloxane-  
methylvinylsiloxane copolymers,  
both end dimethylvinylsiloxane-blocked dimethylsiloxane-  
25 methylphenylsiloxane copolymers,  
both end dimethylvinylsiloxane-blocked dimethylsiloxane-  
diphenylsiloxane copolymers,  
both end divinylmethylethoxyl-blocked dimethylpolysiloxane,  
both end trivinylsiloxy-blocked dimethylpolysiloxane,  
30 both end dimethylhydrogensiloxy-blocked dimethylpolysiloxane,  
both end dimethylhydrogensiloxy-blocked methylhydrogen-  
polysiloxane, and  
both end dimethylhydrogensiloxy-blocked dimethylsiloxane-  
methylhydrogensiloxane copolymers; and  
35       silicone resins of three-dimensional network structure  
such as  
silicone resins comprising  $R_3SiO_{1/2}$  and  $SiO_{4/2}$  units,

silicone resins comprising  $RSiO_{3/2}$  units,  
silicone resins comprising  $R_2SiO_{2/2}$  and  $RSiO_{3/2}$  units, and  
silicone resins comprising  $R_3SiO_{1/2}$ ,  $RSiO_{3/2}$  and  $SiO_{4/2}$  units,  
wherein R represents hydrogen or unsubstituted or fluorine-  
5 substituted monovalent hydrocarbon radicals such as methyl,  
propyl, vinyl, phenyl, and trifluoropropyl.

Preferred of these organopolysiloxanes are hydrosilylated  
organopolysiloxanes each having at least one hydrogen atom  
directly attached to a silicon atom (i.e., SiH).

10 Further desirably, the organopolysiloxane used herein  
contains up to 500 parts, especially 0 to 100 parts by  
weight of non-functional low molecular weight siloxane  
compounds having 3 to 10 silicon atoms (oligomers of 3 to 10  
monomer units), as typified by cyclic polysiloxanes  
15 (especially, cyclic dimethylsiloxane oligomers of 3 to 10  
monomer units), per million parts by weight of the  
organopolysiloxane. If the content of low molecular weight  
siloxane compounds exceeds 500 ppm, the so-called silicone  
low molecular weight problem can arise because the  
20 conductive composition of the invention is intended for use  
in electric and electronic parts, for example.

The organopolysiloxane desirably has a viscosity of 50  
to 100,000 centistokes (cs) at 25°C, especially 100 to 5,000  
cs at 25°C.

25 The fluorinated polyether compounds which are used as  
the surface treating agent are commercially available, for  
example, under the trade name of Krytox from E. I. duPont,  
Fomblin and Garden from Auslimont, and Demnum from Daikin  
Industry K.K. These fluids are generally non-reactive  
30 although they can be fluorinated polyether compounds having  
reactive radicals such as vinyl, hydrosilyl or hydroxyl  
within their molecule like component (A).

The amount of the surface treating agent used is  
usually 0.001 to 5% by weight, preferably 0.1 to 3% by  
35 weight based on the silver particles to be treated  
therewith. Less than 0.001% of the surface treating agent  
would allow primary particles of silver to agglomerate. If  
more than 5% of the surface treating agent is used,

compositions loaded with the treated silver particles would become less conductive and give rise to oil bleeding.

In surface treating silver particles with the surface treating agent, an organic solvent may be used as a medium or cleaning agent. Such organic solvents are not critical. Use may be made of alcoholic organic solvents such as methanol, ethanol, isopropanol, butanol, and ethyleneglycol; aliphatic organic solvents such as hexane, heptane, and octane; alicyclic organic solvents such as cyclohexane and cyclooctane; aromatic organic solvents such as toluene and xylene; ketone organic solvents such as acetone, methyl ethyl ketone, and methyl isobutyl ketone; ester organic solvents such as ethyl acetate and carbitol acetate; and fluorochemical solvents such as  $C_4F_{10}$ ,  $C_8F_{18}$ ,  $C_4F_9OCH_3$ ,  $C_4F_9OC_2H_5$ , 2-n-nonafluorobutyl-tetrafluorofurane, tris(n-nonafluorobutyl)amine, m-xylene hexafluoride, p-xylene hexafluoride, and benzotrifluoride.

The amount of silver particles (D) added is 50 to 2,000 parts, preferably 100 to 1,800 parts by weight per 100 parts by weight of component (A). Compositions with less than 50 parts of silver particles are not fully conductive whereas more than 2,000 parts of silver particles can alleviate the binding effect of curable compositions, resulting in brittle cured products.

In addition to components (A) through (D), any of conventional well-known additives may be added to the composition of the invention insofar as the objects of the invention are not impaired. Such additives include agents for controlling hydrosilylating reaction catalysts such as acetylene alcohols, for example, 1-ethyl-1-hydroxycyclohexane, 3-methyl-1-butyn-3-ol, 3,5-dimethyl-1-hexyn-3-ol, 3-methyl-1-pentyn-3-ol, and phenylbutynol; 3-methyl-3-penten-1-yne and 3,5-dimethyl-3-hexen-1-yne; tackifiers (or adhesive agents) such as organosilanes or organo(poly)-siloxanes containing in a molecule at least one radical selected from alkoxy, epoxy, acryloxy, methacryloxy, acid anhydride and SiH radicals (tackifiers having fluoro-modified radicals in a molecule are preferable since it is

desired that the tackifiers be compatible with component (A)); pigments such as iron oxide, cerium oxide and carbon black; coloring agents, pigments, and antioxidants. These optional additives may be added in conventional amounts as 5 long as the objects of the invention are not impaired.

Depending on a particular application, the composition of the invention may be formulated as a one-part formulation wherein essential components (A) through (D) are handled as one part, or as a two-part formulation wherein components 10 (A), (C) and (D) form one part and components (A), (B) and (D) form another part, which parts are mixed on use.

Alternatively, the composition can be used after dissolving and diluting it in a solvent. The solvent in which component (A) is soluble is preferred. Examples 15 include fluorochemical solvents such as  $C_4F_{10}$ ,  $C_8F_{18}$ ,  $C_4F_9OCH_3$ ,  $C_4F_9OC_2H_5$ , 2-n-nonafluorobutyl-tetrafluorofuran, tris(n-nonafluorobutyl)amine, m-xylene hexafluoride, p-xylene hexafluoride, and benzotrifluoride.

The conductive fluoro-resin composition of the 20 invention readily cures when it is allowed to stand at room temperature or heated. Preferably the composition is cured by heating at room temperature (e.g., 5 to 35°C) to 200°C for 1 minute to 24 hours. The composition cures into conductive rubber having improved properties.

25 There have been described conductive fluoro-resin compositions which cure into rubbery parts having high conductivity, improved heat resistance, weather resistance and solvent resistance and forming firm bonds to various substrates of glass, aluminum, polyesters, epoxy resins or 30 the like. The compositions find effective use in die bonding of semiconductor devices and mounting of quartz crystal oscillators.

EXAMPLE

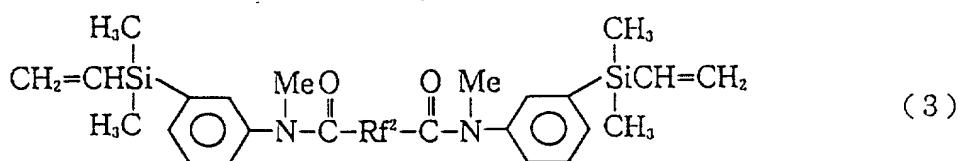

35 Examples of the invention are given below by way of illustration and not by way of limitation. It is noted that the viscosity is a measurement at 25°C, and Me is methyl. All parts are by weight.

Example 1

To 100 parts of a fluorinated polyether polymer of the following formula (3) (viscosity 4,400 cs, number average molecular weight 16,500, vinyl content 0.013 mol/100 g) was 5 added 800 parts of spherical atomized silver (mean particle size 0.2  $\mu\text{m}$ ). Then 2.7 parts of a fluorinated hydrogenated siloxane of the following formula (4) as a crosslinking agent, 0.5 part of a 50% toluene solution of ethynyl cyclohexanol, 1.0 part of a tackifier of the following 10 formula (5), and 10 parts of *m*-xylene hexafluoride were added. After the ingredients were uniformly agitated, 0.2 part of a 1,3-divinyl-1,1,3,3-tetramethyldisiloxane complex of chloroplatinic acid (platinum concentration 1.0 wt%) was 15 added to the mixture and thoroughly mixed therewith. The mixture was cast on a Teflon-coated support. After the solvent volatilized off, the coating was heat cured at 120°C for one hour into a sheet of about 1 mm thick. The sheet was measured for volume resistivity, finding a value of  $3 \times 10^{-5} \Omega\text{-cm}$ .

20 Separately, the composition was applied dropwise onto supports of glass, aluminum, polyester and epoxy resin. After the solvent volatilized off, the coating was heat cured at 120°C for one hour, establishing satisfactory bonds to all the supports.

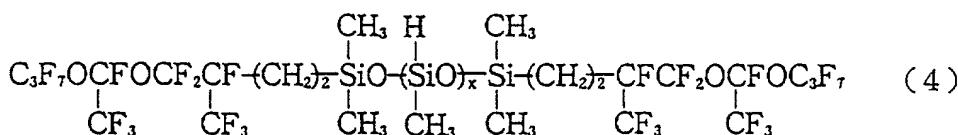

25

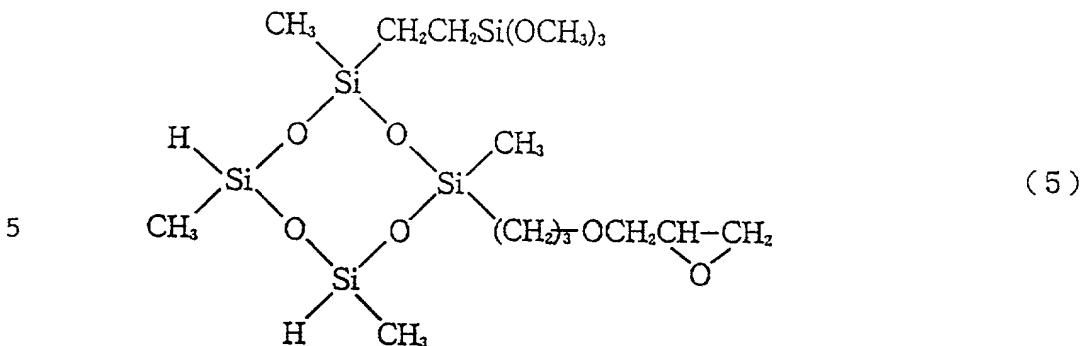

30

35

Example 2

10 To 100 parts of a fluorinated polyether polymer of the following formula (6) (viscosity 12,200 cs, number average molecular weight 16,000, vinyl content 0.013 mol/100 g) were added 46.3 parts of a compound of the following formula (7) as a crosslinking agent, 1.0 part of a compound of the

15 following formula (8) as a tackifier, 800 parts of dimethylsiloxane-treated, flake-shaped silver particles prepared by the procedure described below, 0.5 part of a 50% toluene solution of ethynyl cyclohexanol, and 1.0 part of a tackifier of above formula (5). After the ingredients were

20 uniformly agitated, 0.2 part of a 1,3-divinyl-1,1,3,3-tetramethydisiloxane complex of chloroplatinic acid (platinum concentration 1.0 wt%) was added to the mixture and thoroughly mixed therewith. The mixture was cast on a Teflon-coated support and heat cured at 120°C for one hour

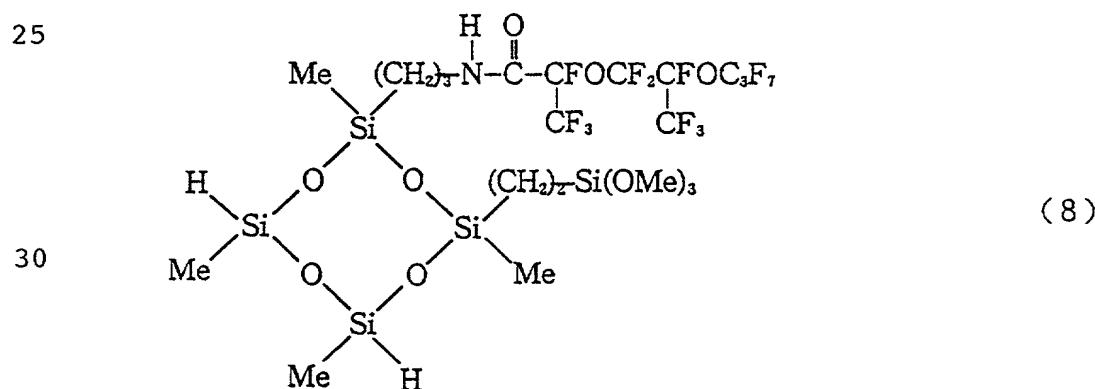

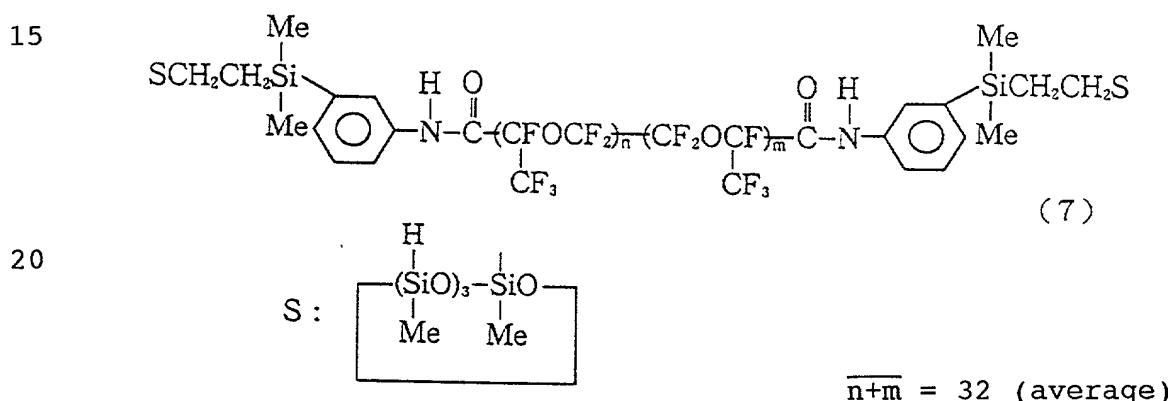

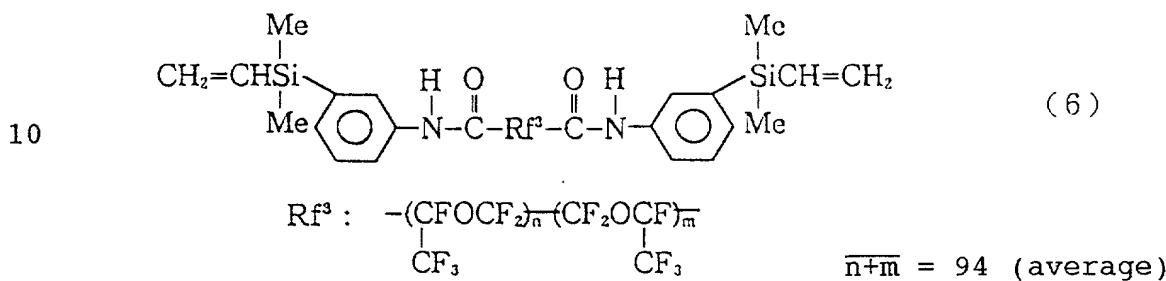

25 into a sheet of about 1 mm thick. The sheet was measured for volume resistivity, finding a value of  $1 \times 10^{-5} \Omega\text{-cm}$ .

Separately, the composition was applied dropwise onto supports of glass, aluminum, polyester and epoxy resin. After the solvent volatilized off, the coating was heat 30 cured at 120°C for one hour, establishing satisfactory bonds to all the supports.

Preparation of dimethylsiloxane treatment of silver particles

Reduced silver powder particles having a mean particle 35 size of 0.8  $\mu\text{m}$  were milled, rolled and surface treated in a ball mill using as a lubricant a linear dimethylpolysiloxane blocked with trimethylsilyl at each end of its molecular

chain, having a viscosity of 5,000 cs at 25°C and containing 150 ppm in total of non-functional low molecular weight cyclic siloxanes (cyclic dimethylsiloxanes) in the form of oligomers of 3 to 10 monomer units. The treated silver 5 powder was washed with toluene, obtaining flake-shaped silver powder having a mean particle size of 5  $\mu\text{m}$ .

Example 3

35 To 100 parts of the fluorinated polyether polymer of  
 formula (6) (viscosity 12,200 cs, number average molecular  
 weight 16,000, vinyl content 0.013 mol/100 g) were added  
 46.3 parts of the compound of formula (7) as a crosslinking

agent, 1.0 part of the compound of formula (8) as a tackifier, 800 parts of hydrogenated siloxane-treated, flake-shaped silver particles prepared by the procedure described below, 0.5 part of a 50% toluene solution of 5 ethynyl cyclohexanol, and 1.0 part of the tackifier of formula (5). After the ingredients were uniformly agitated, 0.2 part of a 1,3-divinyl-1,1,3,3-tetramethydisiloxane complex of chloroplatinic acid (platinum concentration 1.0 wt%) was added to the mixture and thoroughly mixed 10 therewith. The mixture was cast on a Teflon-coated support and heat cured at 120°C for one hour into a sheet of about 1 mm thick. The sheet was measured for volume resistivity, finding a value of  $4 \times 10^{-5}$  Ω-cm.

15 Separately, the composition was applied dropwise onto supports of glass, aluminum, polyester and epoxy resin. After the solvent volatilized off, the coating was heat cured at 120°C for one hour, establishing satisfactory bonds to all the supports.

20 Preparation or hydrogenated-siloxane treatment of silver particles

25 In a flask, 1,200 g of a hydrogenated siloxane, 1,3,5,7-tetrahydro-1,3,5,7-tetramethylcyclotetrasiloxane and 132 g of 1,1,3,3-tetramethyldisiloxane were mixed, to which 1 g of fuming sulfuric acid was added as a catalyst. Agitation was continued at 25°C for 24 hours. Thereafter, 5 g of sodium hydrogen carbonate was added to the mixture, which was filtered. A fraction was distilled off at 80°C and 1 mmHg, collecting methylhydrogenpolysiloxane having a viscosity of 15 cs. Gas chromatography confirmed that this 30 polysiloxane was free of non-functional low molecular weight siloxanes (cyclic dimethylsiloxanes).

Reduced silver powder particles having a mean particle size of 0.8  $\mu\text{m}$  were milled, rolled and surface treated in a ball mill using the hydrogenated polysiloxane as a 35 lubricant. The treated silver powder was washed with toluene, obtaining flake-shaped silver powder having a mean particle size of 5  $\mu\text{m}$ .

Example 4

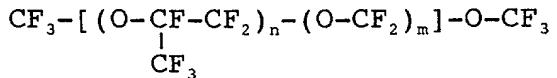

To 100 parts of the fluorinated polyether polymer of formula (6) (viscosity 12,200 cs, number average molecular weight 16,000, vinyl content 0.013 mol/100 g) were added  
5 46.3 parts of the compound of formula (7) as a crosslinking agent, 1.0 part of the compound of formula (8) as a tackifier, 800 parts of fluorinated polyether-treated, flake-shaped silver particles prepared by the procedure described below, 0.5 part of a 50% toluene solution of  
10 ethynyl cyclohexanol, and 1.0 part of the tackifier of formula (5). After the ingredients were uniformly agitated, 0.2 part of a 1,3-divinyl-1,1,3,3-tetramethydisiloxane complex of chloroplatinic acid (platinum concentration 1.0 wt%) was added to the mixture and thoroughly mixed  
15 therewith. The mixture was cast on a Teflon-coated support and heat cured at 120°C for one hour into a sheet of about 1 mm thick. The sheet was measured for volume resistivity, finding a value of  $8 \times 10^{-4}$  Ω-cm.

Separately, the composition was applied dropwise onto  
20 supports of glass, aluminum, polyester and epoxy resin. After the solvent volatilized off, the coating was heat cured at 120°C for one hour, establishing satisfactory bonds to all the supports.

Preparation of fluorinated-polyether treatment of  
25 silver particles

Reduced silver powder particles having a mean particle size of 0.8  $\mu\text{m}$  were milled, rolled and surface treated in a ball mill using FOMBLIN-YR as a lubricant. The treated silver powder was washed with m-xylene hexafluoride,  
30 obtaining flake-shaped silver powder having a mean particle size of 5  $\mu\text{m}$ . FOMBLIN-YR was a linear perfluoropolyether fluid having a number average molecular weight of 6,250 and a viscosity of 1,500 cs at 20°C commercially available from Auslimont. Its structural formula is given below.

35

Reference Example 1

To 100 parts of the fluorinated polyether polymer of formula (6) (viscosity 12,200 cs, number average molecular weight 16,000, vinyl content 0.013 mol/100 g) were added 5 46.3 parts of the compound of formula (7) as a crosslinking agent, 1.0 part of the compound of formula (8) as a tackifier, 800 parts of fatty acid-treated, flake-shaped silver particles prepared by the procedure described below, 10 0.5 part of a 50% toluene solution of ethynyl cyclohexanol, and 1.0 part of the tackifier of formula (5). After the ingredients were uniformly agitated, 0.2 part of a 1,3-divinyl-1,1,3,3-tetramethyldisiloxane complex of 15 chloroplatinic acid (platinum concentration 1.0 wt%) was added to the mixture and thoroughly mixed therewith. The mixture was cast on a Teflon-coated support and heated at 120°C for one hour, but the desired rubber sheet was not obtained owing to the hindered curing by the fatty acid.

Preparation or fatty acid treatment of silver particles

Reduced silver powder particles having a mean particle 20 size of 0.8  $\mu\text{m}$  were milled, rolled and surface treated in a ball mill using lauric acid as a lubricant. The treated silver powder was washed with toluene, obtaining flake-shaped silver powder having a mean particle size of 5  $\mu\text{m}$ .

25 Reference Example 2

To 100 parts of the fluorinated polyether polymer of formula (6) (viscosity 12,200 cs, number average molecular weight 16,000, vinyl content 0.013 mol/100 g) were added 30 46.3 parts of the compound of formula (7) as a crosslinking agent, 1.0 part of the compound of formula (8) as a tackifier, 800 parts of fatty acid ester-treated, flake-shaped silver particles prepared by the procedure described below, 0.5 part of a 50% toluene solution of ethynyl cyclohexanol, and 1.0 part of the tackifier of formula (5). 35 After the ingredients were uniformly agitated, 0.2 part of a 1,3-divinyl-1,1,3,3-tetramethyldisiloxane complex of chloroplatinic acid (platinum concentration 1.0 wt%) was

added to the mixture and thoroughly mixed therewith. The mixture was cast on a Teflon-coated support and heated at 120°C for one hour into a sheet of about 1 mm thick. The sheet was measured for volume resistivity, finding a value 5 of  $3 \times 10^{-3}$  Ω-cm.

Separately, the composition was applied dropwise onto supports of glass, aluminum, polyester and epoxy resin. After the solvent volatilized off, the coating was heat cured at 120°C for one hour, failing to bond to all the 10 supports.

Preparation or fatty acid ester treatment of silver particles

Reduced silver powder particles having a mean particle size of 0.8 μm were milled, rolled and surface treated in a 15 ball mill using ethyl laurate as a lubricant. The treated silver powder was washed with toluene, obtaining flake-shaped silver powder having a mean particle size of 5 μm.

20 Japanese Patent Application No. 362614/1997 is incorporated herein by reference.

Although some preferred embodiments have been described, many modifications and variations may be made thereto in the light of the above teachings. It is therefore to be understood that within the scope of the 25 appended claims, the invention may be practiced otherwise than as specifically described.

CLAIMS:

1. A conductive fluoro-resin composition comprising
  - (A) 100 parts by weight of a reactive fluorinated polyether compound comprising fluorinated polyether units and having at least two aliphatic unsaturated hydrocarbon radicals in a molecule,
    - (B) a compound having at least two hydrogen atoms each directly attached to a silicon atom in a sufficient amount to give 0.4 to 10 equivalents of the silicon atom-attached hydrogen atoms relative to the aliphatic unsaturated hydrocarbon radicals in component (A),
    - (C) a sufficient amount of a platinum group metal catalyst to promote reaction between components (A) and (B),
    - (D) 50 to 2,000 parts by weight of silver particles.
2. The conductive fluoro-resin composition of claim 1 wherein the reactive fluorinated polyether compound (A) comprises fluorinated polyether units of the following structural formula (1):
$$-(Rf-O)_q-$$
 (1)
3. The conductive fluoro-resin composition of claim 1 wherein the silver particles (D) contain at least 10% by weight of dendrite or flake shaped silver particles based on the loading of the silver particles.
4. The conductive fluoro-resin composition of claim 3 wherein the silver particles (D) have been surface treated with an organopolysiloxane or fluorinated polyether compound.

5. The conductive fluoro-resin composition of claim 4 wherein said organopolysiloxane is a hydrosilylated organopolysiloxane having at least one hydrogen atom directly attached to a silicon atom.

5

6. The conductive fluoro-resin composition of claim 4 wherein said organopolysiloxane contains up to 500 ppm of non-functional low molecular weight organopolysiloxanes having 3 to 10 silicon atoms.

60 50 40 30 20 10 0

ABSTRACT

A conductive fluoro-resin composition of the addition reaction curing type is provided comprising (A) a reactive fluorinated polyether compound comprising fluorinated polyether units and having at least two aliphatic unsaturated hydrocarbon radicals in a molecule, (B) a compound having at least two hydrogen atoms each directly attached to a silicon atom, (C) a platinum group metal catalyst, and (D) silver particles. The composition cures into rubbery parts having improved heat resistance, weather resistance and solvent resistance and optionally forming firm bonds to various substrates.

## COMBINED DECLARATION FOR PATENT APPLICATION AND POWER OF ATTORNEY

(Includes Reference to PCT International Applications)

ATTORNEY'S DOCKET NUMBER

As a below named inventor, I hereby declare that:

My residence, post office address and citizenship are as stated below next to my name,

I believe I am the original, first and sole inventor (if only one name is listed below) or an original, first and joint inventor (if plural names are listed below) of the subject matter which is claimed and for which a patent is sought on the invention entitled:

Conductive Fluoro-Resin Compositions

the specification of which (check only one item below):

 is attached hereto. was filed as United States application

Serial No. \_\_\_\_\_

on \_\_\_\_\_,

and was amended

on \_\_\_\_\_ (if applicable).

 was filed as PCT international application

Number \_\_\_\_\_

on \_\_\_\_\_,

and was amended under PCT Article 19

on \_\_\_\_\_ (if applicable).

I hereby state that I have reviewed and understand the contents of the above-identified specification, including the claims, as amended by any amendment referred to above.

I acknowledge the duty to disclose information which is material to the examination of this application in accordance with Title 37, Code of Federal Regulations, §1.56(a).

I hereby claim foreign priority benefits under Title 35, United States Code, §119 of any foreign application(s) for patent or inventor's certificate or of any PCT international application(s) designating at least one country other than the United States of America listed below and have also identified below any foreign application(s) for patent or inventor's certificate or any PCT international application(s) designating at least one country other than the United States of America filed by me on the same subject matter having a filing date before that of the application(s) of which priority is claimed:

## PRIOR FOREIGN/PCT APPLICATION(S) AND ANY PRIORITY CLAIMS UNDER 35 U.S.C. 119:
